I am running the newest version of Jamaseis on Windows 7 enterprise connected to an SEP garden gate seismometer connected through the USB socket. The programme runs collecting and displaying data merrily for a number of hours (around 30-40,000 samples) but then suddenly stops collecting data. The problem is fixed by unplugging and reattaching the USB into a different socket and then restarting Jamaseis. The problem has only cropped up since I have updated both Jamaseis and MS software recently. What is the problem? How do I fix it? Thank you.
